this book offers a snapshot of recent developments in improving the properties and performance of engineering materials and structures it discusses modeling properties related to classical mechanical thermal electrical and optical fields as well as those related to surface specific quantities e g roughness wear and modifications due to surface coatings the material types presented range from classical metals and synthetic materials to composites competitiveness due to cost efficiency e g lighter structures and the corresponding fuel savings for transportation systems and sustainability e g recyclability or reusability are the driving factors for engineering developments the outcomes of these efforts are difficult to be accurately monitored due to the ongoing evaluation cycles

the use of lightweight structures across several industries has become inevitable in today s world given the ever rising demand for improved fuel economy and resource efficiency in the automotive industry composites reinforced plastics and lightweight materials such as aluminum and magnesium are being adopted by many oems at increasing rates to reduce vehicle mass and develop efficient new lightweight designs automotive weight reduction with high strength steel is also witnessing major ongoing efforts to design novel damage controlled forming processes for a new generation of efficient lightweight steel components although great progress has been made over the past decades in understanding the thermomechanical behavior of these

materials their extensive use as lightweight solutions is still limited due to numerous challenges that play a key role in cost competitiveness hence significant research efforts are still required to fully understand the anisotropic material behavior failure mechanisms and most importantly the interplay between industrial processing microstructure development and the resulting properties this special issue reprint book features concise reports on the current status in the field the topics discussed herein include areas of manufacturing and processing technologies of materials for lightweight applications innovative microstructure and process design concepts and advanced characterization techniques combined with modeling of material s behavior

this book provides an overview of state of the art methods in computational engineering for modeling and simulation this proceedings volume includes a selection of refereed papers presented at the international conference on advances in computational mechanics acome 2017 which took place on phu quoc island vietnam on august 2 4 2017 the contributions highlight recent advances in and innovative applications of computational mechanics subjects covered include biological systems damage fracture and failure flow problems multiscale multiphysics problems composites and hybrid structures optimization and inverse problems lightweight structures computational mechatronics computational dynamics numerical methods and high performance computing the book is intended for academics including graduate students and experienced researchers interested in state of the art computational methods for solving challenging problems in engineering

this book contains papers presented at the 10th annual esaform conference which covers the multitude of disciplines related to material forming this year s conference features for the first time an eccomas thematic conference devoted to new advanced numerical strategies in forming simulation which has been traditionally one of the mini symposia of the conference
